You're home and dry

protect

your home from the effects of excess moisture

Your home is your haven. The place where you live, relax, entertain and sleep. It's an investment too. So it's important you protect it, not just from burglars, but from the damaging and distressing effects of moisture. After all, prevention is far better than cure and why an Ebac dehumidifier is the essential home protection unit.

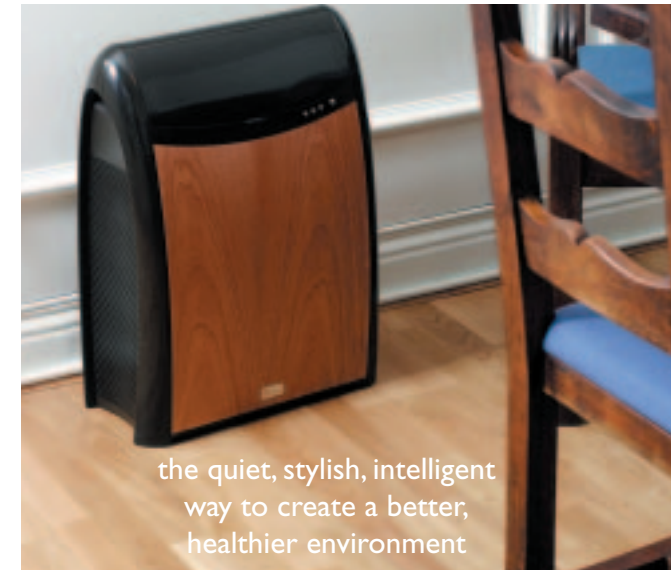

What causes damp and condensation in the home?

All air, quite naturally, contains a degree of moisture. Perfectly normal everyday things we do, from showering to even breathing all add to the moisture in our homes. Central heating – which actually disguises moisture in the air – double glazing and sealing around doors just make matters worse. When warm moisture-laden air meets cold surfaces such as windows and walls, it condenses creating condensation on windows and damp walls. Moisture will also go into the external wall and condense. This is because the inside of the wall is usually colder than the air in the room.

In time, moisture causes mould, or worse, damages the actual fibre of your home. Expensive, unsightly and inconvenient redecoration, repair of walls and replacement of rotten woodwork can all be easily avoided with regular use of an Ebac dehumidifier.

Your Ebac dehumidifier has been specifically designed to cope with Britain's unique and unsettled climate by Europe's No.1 manufacturer of dehumidifiers.

the quiet, stylish, intelligent way to create a better, healthier environment

Take a look around your home. You'll be amazed where the moisture can come from. Simple things such as making a cup of coffee, cooking a meal, washing up, washing and drying laundry, a quick shower or a long leisurely bath. They will all add extra moisture to the air in your home.

The average family can produce up to 12 litres (20 pints) per day

Excess moisture can be a threat not just to your home, but to your health too. At just 60% relative humidity, dust-mites thrive and can increase the risk of discomfort to anyone with breathing problems. Arthritis and rheumatism sufferers all know what effect damp air can have on them.

The 6000 can quietly and efficiently extract the extra moisture. It's economical, costing typically just 2p an hour when in operation. As well as removing this extra moisture it heats the air by approx 3°C thereby setting off some of this running cost by reducing your central heating requirements.

Furthermore, a dehumidifier makes a home drier which means that even less heating is required. Heating can be off for longer periods and/or the temperature turned down. A 1°C lower thermostat setting will reduce the heating cost by 10%.

That's why you're home and dry

You're convinced you need a dehumidifier. But why do you need an Ebac 6000? Surely all dehumidifiers operate in the same way? The basic principle is the same however, that's where the similarity ends.

- Top loading for ease of use

- Revolutionary new shape
- Range of finishes
- SMART CONTROL

get smart

The patented SMART control is unique to Ebac. It automatically determines the best time to be on and the best time to be off. So it always works to maximum efficiency and effectiveness.*

Our unique SMART control* learns about your home

The British climate varies not just from day to day but place to place, too. And as every home is built, decorated, used, ventilated and heated differently, it's impossible to have a dehumidifier designed specifically for you and your home. Impossible unless you've Ebac SMART Control.*

This intelligent technology quite literally gets to know not just your home, but your daily routines, too. How? A 24-hour memory chip constantly samples, monitors and compares the changing humidity with the base humidity over the day.

It then activates itself automatically at the optimum time to remove moisture when air humidity is at its highest. All without you so much as lifting a finger. We did say it was smart.

An Ebac dehumidifier cleverly uses the problem of condensation as the principle to solve the problem. Here's how:

1. A very quiet, yet powerful, motor draws air into the unit, which is passed over a chilled surface.
2. As the air cools, moisture condenses and is collected in the dehumidifier's removable container.
3. When the container is full, it automatically cuts out and a 'container-full' warning light is activated. An audible nearly full and full alarm can be activated if required.
4. A heat exchanger takes the energy used in the cooling process and uses it to heat the drier air released back into your home.
5. All feature Ebac's New Patented Smart control which monitors your home and decides when to run. This ensures that the unit is on when it should be on and when it should be off. This saves you money by not running when it doesn't need to and offers maximum protection by ensuring it runs when it should. Smart control removes the need for you to keep adjusting a humidistat to your changing needs as its fully automatic.

Unlike some imported models, Ebac dehumidifiers are designed for the British climate. They periodically defrost any ice that forms inside the unit.

Beware when comparing dehumidifier extractions since the maximums quoted by all manufacturers are at conditions never experienced in European climates. On the other hand, Ebac dehumidifiers are designed specifically for the cold, damp UK winter weather. No other system works so effectively to beat condensation in British homes.

6000 Series

The 6000 is a powerful, light, compact and portable solution to your condensation problems.

Filters

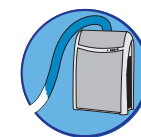

All 6000 Series models are available with a comprehensive range of air filters – each designed to last approximately three months.

Accessories

Castors

Although lightweight and portable, adding a castor kit to your 6000 makes it even easier to move as it can be simply wheeled to desired location.

Continuous Drain Kit

Allows the 6000 to be used in unoccupied areas such as garages, holiday homes and caravans where emptying the water container is not possible. A drainage kit allows water to be pumped away using the internal pump in the unit.

An Ebac dehumidifier won't just make a difference to your home, it can actually change the way you feel. Dust mites and various bacteria and fungi thrive in warm moist conditions. By changing the climate in your home, and using Ebac's range of optional filters, even non-suffers of allergies, asthma, bronchitis and rheumatism will generally feel more healthy in a warmer, drier home environment.

specifications

	6200
Suitable for homes with upto 5 bedrooms	✓
Elegant and stylish	✓
Patented SMART control	✓
Quiet operation	✓
Power-on indicator	✓
Standby mode	✓

who

are Ebac?

Ebac are passionate about improving the air quality in your home and protecting it from the damaging effects of moisture, condensation and dampness. For the past 30 years Ebac have pioneered the dehumidifier market in Europe, designing and manufacturing premium dehumidifiers specifically for the European climate.

Ebac is a family run business, and it recognises that owning a dehumidifier can bring vast improvements to any home. Not all homes are the same, and Ebac have developed a large range of dehumidifiers to suite all homes. All Ebac dehumidifiers are designed and manufactured in the UK to very high quality standards. The 6000 series represents the very best on the market in terms of value for money, style, features and performance.
